For Use with ICU Medical Plum Infusion Devices, Including the Plum A+™ and the Plum 360™

Ensure that the pump is turned off and disconnected from power, and remove administration set. Inspect the infuser enclosure for cracks and damage. Clean the infuser to remove visible dirt, organic soil, and residue from spilled fluid to prepare the infuser for disinfection, then follow the steps below.

1. With gloves on, spray approved disinfectant solution on a clean, lint-free cloth or remove a towelette from its dispenser.

2. To expose maximum surface area, ensure that the cloth/towelette is completely unfolded.

3. Use a spiral pattern when wiping, moving from the inner to outer edges of each surface to avoid recontaminating the areas you have already wiped. Change cloths or wipes as needed to avoid spreading the spill from one area of the infuser to another.

4. Carefully clean/swab all elements behind the cassette door without tilting the infuser backwards.

5. Dispose of the used cloth/towelette in an appropriate receptacle per facility policy.

6. Remove gloves and discard. Wash hands.

CAUTION: Do not spray cleaning solution towards any opening in the infuser.

For a current list of ICU Medical-approved cleaning products and instructions, please refer to the appropriate ICU Medical Plum System Operating Manual or call 1-800-241-4002.
